

Further sigma notation

Tom Coleman, Ifan Howells-Baines, Mark Toner

Summary

Sigma notation is used to express many additions at once. Understanding what this notation is, how it works, and how to manipulate them is a valuable skill to learn for use in almost any area of mathematics.

Properties

In this section you will learn about a few properties of sigma notation which means you'll have a toolkit to rearrange sums!

The first property you'll learn about sigma notation is *distributivity*. This property allows you to take constants from inside the sigma notation to outside the summation.

Distributivity

Let a_k, a_{k+1}, \dots, a_n be a sequence of numbers (where k and n are integers with $k \leq n$) and C be any constant. Then

$$\sum_{i=k}^n C a_i = C \sum_{i=k}^n a_i.$$

You can see this is true by writing the entire sum out, like this:

$$\begin{aligned} \sum_{i=k}^n C a_i &= C a_k + C a_{k+1} + C a_{k+2} + \dots + C a_n \\ &= C(a_k + a_{k+1} + a_{k+2} + \dots + a_n) \\ &= C \sum_{i=k}^n a_i \end{aligned}$$

Example 7

What is the value of $\sum_{n=2}^5 6n^2$?

Using distributivity, $\sum_{n=2}^5 6n^2 = 6 \sum_{n=2}^5 n^2$. From Example 2, you know that $\sum_{n=2}^5 n^2 = 54$. Therefore, $6 \sum_{n=2}^5 n^2 = 6 \times 54 = 324$.

Double sums

Sometimes, you'll want to multiply two sums together. This can be written succinctly using something called *double sums*.

Double sums

Let a_k, a_{k+1}, \dots, a_n and b_t, b_{t+1}, \dots, b_m be two sequences of numbers (where k, n, t , and m are integers with $k \leq n$ and $t \leq m$). Then the **double sum** $\sum_{i=k}^n \sum_{j=t}^m a_i b_j$ is defined as

$$\begin{aligned} \sum_{i=k}^n \sum_{j=t}^m a_i b_j &= a_k b_t + a_k b_{t+1} + \dots + a_k b_m + a_{k+1} b_t + a_{k+1} b_{t+1} \\ &\quad + \dots + a_{k+1} b_m + \dots + a_n b_m. \end{aligned}$$

Tip

You might find it easier to remember the above by thinking of $\sum_{i=k}^n \sum_{j=t}^m a_i b_j$ as $a_1(\sum_{j=t}^m b_j) + a_2(\sum_{j=t}^m b_j) + \dots + a_n(\sum_{j=t}^m b_j)$.

You will now see how this relates to multiplying two sums together. Suppose that a_k, a_{k+1}, \dots, a_n and b_t, b_{t+1}, \dots, b_m are like above, and consider the product $(\sum_{i=k}^n a_i)(\sum_{j=t}^m b_j)$. Writing it all out and performing the multiplication, you get

$$\begin{aligned} (\sum_{i=k}^n a_i) (\sum_{j=t}^m b_j) &= (a_k + a_{k+1} + \dots + a_n)(b_t + b_{t+1} + \dots + b_m) \\ &= a_k b_t + a_k b_{t+1} + \dots + a_k b_m + a_{k+1} b_t + a_{k+1} b_{t+1} + \\ &\quad \dots + a_{k+1} b_m + a_{k+2} b_t + \dots + a_n b_m \\ &= \sum_{i=k}^n \sum_{j=t}^m a_i b_j \end{aligned}$$

You can write this as a result:

Double sums and products of two sums

Let a_k, a_{k+1}, \dots, a_n and b_t, b_{t+1}, \dots, b_m be two sequences of numbers (where k, n, t , and m are integers with $k \leq n$ and $t \leq m$). Then

$$\sum_{i=k}^n \sum_{j=t}^m a_i b_j = (\sum_{i=k}^n a_i) (\sum_{j=t}^m b_j).$$

i Example 10

Write $(1 + 2 + 3 + 4 + 5 + 6)(2 + 4 + 6 + 8 + 10 + 12)$ as a double sum and as a product of two sums.

First, notice you can write out the above expression in the form $(1)(2) + (1)(4) + \dots(1)(12) + (2)(2) + (2)(4) \dots(3)(2) + \dots(6)(12)$

From the definition above you may now rewrite the expression to the double sum

$$\sum_{i=1}^6 \sum_{j=1}^6 i * 2j$$

using the distributivity property this can be written as

$$2 \sum_{i=1}^6 \sum_{j=1}^6 ij$$

This can then be written using the product of two sums rule above to

$$2 \sum_{i=1}^6 i \sum_{j=1}^6 j$$

It is evident that the two sums are the same with different index variables this means that they can be combined to form

$$2 \sum_{k=1}^6 k^2$$

k has been used to differentiate the new sum from the ones involving i and j before but as always the choice of index variable is relatively unimportant

Quick check problems

1. What is the value of $\sum_{i=2}^6 i$.

Answer: The value of the above is: ____.

2. Given $\sum_{j=1}^{100} i$ Identify the index of the sum.

Answer: The index is __

3. You are given several statements below based on the properties of sums. Identify whether they are true or false.

(a) The sum $3 + 6 + 9 + 12$ can be expressed as $\sum_{i=0}^4 3i$ Answer: TRUE / FALSE.

(b) The sum $-1 + 1 - 1 + 1$ can be expressed as $\sum_{i=1}^4 -i$ Answer: TRUE / FALSE.

(c) $\sum_{i=1}^{100} i = \sum_{i=0}^{101} i$ Answer: TRUE / FALSE.

(d) $\sum_{i=1}^{100} 6i = 6 \sum_{i=0}^{100} i$ Answer: TRUE / FALSE.

(e) $\sum_{i=1}^{100} 9i + \sum_{i=1}^{100} 3i = \sum_{i=1}^{100} 27i^2$ Answer: TRUE / FALSE.

(f) $\sum_{i=1}^{100} 12i - \sum_{i=1}^{100} 4i = 8 \sum_{i=1}^{100} i$ Answer: TRUE / FALSE.

4. You are given several statements below based on the properties of sums. Identify whether they are true or false.

(a) $\sum_{i=1}^{10} \sum_{j=2}^6 ij$ can be expressed as $\left(\sum_{i=2}^6 i \right) \left(\sum_{j=1}^{10} j \right)$ Answer: TRUE / FALSE.

(b) $\left(\sum_{i=1}^5 2i \right) \left(\sum_{j=5}^{10} 3j \right)$ can be expressed as $6 \left(\sum_{i=1}^5 \sum_{j=5}^{10} ij \right)$ Answer: TRUE / FALSE.

(c) The sum $(1+2+3+4+5+6)(-1-2)(3+6+9)$ can be expressed as $\sum_{i=1}^6 \sum_{j=1}^2 \sum_{k=1}^3 -3ijk$
Answer: TRUE / FALSE.
