

# Introduction to integration

Tom Coleman

## Summary

The idea of integration...

*Before reading this guide, it is recommended that you read [Guide: Properties of functions], [Guide: Laws of indices], [Guide: Logarithms], and [Guide: Tangents].*

## What is integration

This guide will look at the idea of differentiation; where it comes from, how it can be used, and how you can apply its techniques to functions that you may be familiar with.

## Flowchart test

### **i** Example 4

Determine the behaviour of the function  $f(x) = 2 \ln(3x) - x$  when  $x = 1$ .

Here, you will first need to differentiate the function  $f(x)$  to find  $f'(x)$ . Then, you will need to evaluate the derivative  $f'(x)$  when  $x = 1$  to see how the function behaves.

Using your rules of differentiation as you found above, you can say that the derivative of  $2 \ln(3x)$  is  $2/x$ , and the derivative of  $x$  is 1. Therefore, the derivative of the function  $f(x) = 2 \ln(3x) - x$  is

$$f'(x) = \frac{2}{x} - 1.$$

You can evaluate the derivative  $f'(x)$  at  $x = 1$  to get

$$f'(1) = \frac{2}{1} - 1 = 2 - 1 = 1$$

and so the derivative is positive at  $x = 1$ . This implies that the function  $f(x) = 2 \ln(3x) - x$  is increasing at the point  $x = 1$ .

It also means that the gradient of the tangent to the function  $f(x)$  at the point  $(1, 2 \ln(3) - 1)$  is 1. You can see this in the figure below.

Figure 1: The graph of  $f(x) = 2 \ln(3x) - x$ , with the tangent to the graph at  $(1, 2 \ln(3) - 1)$  illustrated, demonstrating that the function is increasing at  $x = 1$ .

## Summary

Here's a table of derivatives that you should remember going into any further reading on differentiation. Here,  $a, b, c, n$  are any real numbers.

Function $f(x)$	Derivative $f'(x)$	Notes
$f(x) = c$	$f'(x) = 0$	
$f(x) = ax + b$	$f'(x) = a$	
$f(x) = ax^n$	$f'(x) = anx^{n-1}$	$n \neq 0$
$f(x) = ae^{bx}$	$f'(x) = abe^{bx}$	
$f(x) = a \sin(bx)$	$f'(x) = ab \cos(bx)$	
$f(x) = a \cos(bx)$	$f'(x) = -ab \sin(bx)$	
$f(x) = a \ln(bx)$	$f'(x) = \frac{a}{x}$	

## Quick check problems

1. Answer the following questions true or false:

- (a) The derivative of a function at  $x = a$  is equal to the gradient of the tangent to  $f(x)$  at  $x = a$ .
- (b) If  $f'(a) < 0$ , then the function is increasing at  $x = a$ .
- (c) If  $f(x) = c$ , then the derivative  $f'(x) = c - 1$ .
- (d) The derivative of  $f(x) = \cos(x)$  is  $f'(x) = -\sin(x)$ .
- (e) The derivative of  $f(x) = \frac{1}{x}$  is  $f'(x) = \ln(x)$ .
- (f) The power of  $x$  in the derivative of  $f(x) = \frac{1}{\sqrt{x}}$  is  $-3/2$ .

2. Differentiate the following functions with respect to  $x$ .

- (a)  $f(x) = 3x^7 - 14x$
- (b)  $f(x) = -4\cos(3x)$
- (c)  $f(x) = -15\sin(x) + e^{8x}$
