Answers: Vector addition and scalar multiplication

Renee Knapp, Kin Wang Pang

Summary

Answers to questions relating to the guide on vector addition and scalar multiplication.

These are the answers to Questions: Addition and scalar multiplication.

Please attempt the questions before reading these answers!

Q1

1.1. For the $\bf i$ component, 4+8=12. For the $\bf j$ component, 5+2=7. For the $\bf k$ component, 7+4=11. So the answer is $\bf a+b=12i+7j+11k$.

1.2. $\mathbf{a} + \mathbf{b} = 2\mathbf{i} + 3\mathbf{j} + 9\mathbf{k}$.

1.3. $\mathbf{a} - \mathbf{b} = 2\mathbf{i} - 11\mathbf{j} + 14\mathbf{k}$.

1.4. You can solve this by doing addition componentwise. i component: 4-(3+11)=-10, j component: 12-(-3-4)=19, k component: -7-(-2+9)=-14. So the answer is $-10\mathbf{i}+19\mathbf{j}-14\mathbf{k}$.

Q2

$$2.1. \mathbf{a} + \mathbf{b} = \begin{bmatrix} 4x \\ 7y \\ 0 \end{bmatrix}$$

2.2.
$$\mathbf{a} - \mathbf{b} = \begin{bmatrix} 7 \\ 3y - 2x \\ -z \end{bmatrix}$$

2.3.
$$\mathbf{a} + \mathbf{b} - \mathbf{c} = \mathbf{0}$$
 or $\begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$.

2.4. a.

Q3

3.1. $3\mathbf{u} = (3)5\mathbf{j} + (3)6\mathbf{k} = 15\mathbf{j} + 18\mathbf{k}$.

$$3.2. -6\mathbf{v} = \begin{bmatrix} 0 \\ 18 \\ -42 \end{bmatrix}.$$

$$3.3. \ 4\mathbf{v} - 3\mathbf{u} = \begin{bmatrix} 0 \\ -27 \\ 10 \end{bmatrix}$$

3.4.
$$-2\mathbf{w} - (4\mathbf{u} - 2\mathbf{v}) = \begin{bmatrix} -4\\ -32\\ -2 \end{bmatrix}$$

Q4

4.1. By the laws of vector addition, $\overrightarrow{AB} = \overrightarrow{AO} + \overrightarrow{OB} = -\overrightarrow{OA} + \overrightarrow{OB}$, where \overrightarrow{OA} and \overrightarrow{OB} are the respective coordinates of A and B written in vector form. You can find \overrightarrow{AB} by solving

the above equation.
$$\overrightarrow{AB}=\begin{bmatrix} -2-3\\ 5-4\\ 7-5 \end{bmatrix}=\begin{bmatrix} -5\\ 1\\ 2 \end{bmatrix}$$

$$4.2.\overrightarrow{AB} = \begin{bmatrix} 4 \\ 6 \\ 0 \end{bmatrix}, \ \overrightarrow{AC} = \begin{bmatrix} -2 \\ -4 \\ -5 \end{bmatrix}. \ \overrightarrow{AB} - \overrightarrow{AC} = \begin{bmatrix} 6 \\ 10 \\ 5 \end{bmatrix}. \ \text{You can also calculate this by noticing}$$

$$\overrightarrow{AB} - \overrightarrow{AC} = \overrightarrow{CA} + \overrightarrow{AB} = \overrightarrow{CB}. \text{ Then } \overrightarrow{CB} = \begin{bmatrix} 6 - 0 \\ 11 - 1 \\ 7 - 2 \end{bmatrix} = \begin{bmatrix} 6 \\ 10 \\ 5 \end{bmatrix} \text{ as required.}$$

$$4.3. \ \overrightarrow{AB} = \overrightarrow{OB} - \overrightarrow{OA}. \ \begin{bmatrix} 1 \\ 5 \\ 9 \end{bmatrix} - \begin{bmatrix} a_1 \\ a_2 \\ a_3 \end{bmatrix} = \begin{bmatrix} 6 \\ 7 \\ -2 \end{bmatrix}. \ \text{Solving this gives } A = (-5, -2, 11).$$

4.4. Let λ and μ be scalars. $\lambda \mathbf{a} + \mu \mathbf{b} = 13\mathbf{i} - 9\mathbf{j}$. This gives you the simultaneous equations

$$2\lambda + 3\mu = 13$$
 (i component)

$$3\lambda - 5\mu = -9 (j component)$$

Solving this gives $\mu=3$, $\lambda=2$, which gives the answer $2\mathbf{a}+3\mathbf{b}$.

4.5.
$$2\begin{bmatrix}2\\5\\z\end{bmatrix}+3\begin{bmatrix}-1\\-3\\4\end{bmatrix}=\begin{bmatrix}x\\y\\0\end{bmatrix}$$
. Solving this gives $x=3$, $y=1$ and $z=-6$.

4.6. As they are parallel $a = \lambda b$ for some real scalar λ . This gives the simultaneous equations

$$x-7=-2\lambda$$
 (i component) $5x+1=8\lambda$ (k component)

Eliminating λ and solving gives x=3.
