

# Factsheet: Poisson distribution

Michelle Arnetta and Tom Coleman

## Summary

A factsheet for the Poisson distribution.

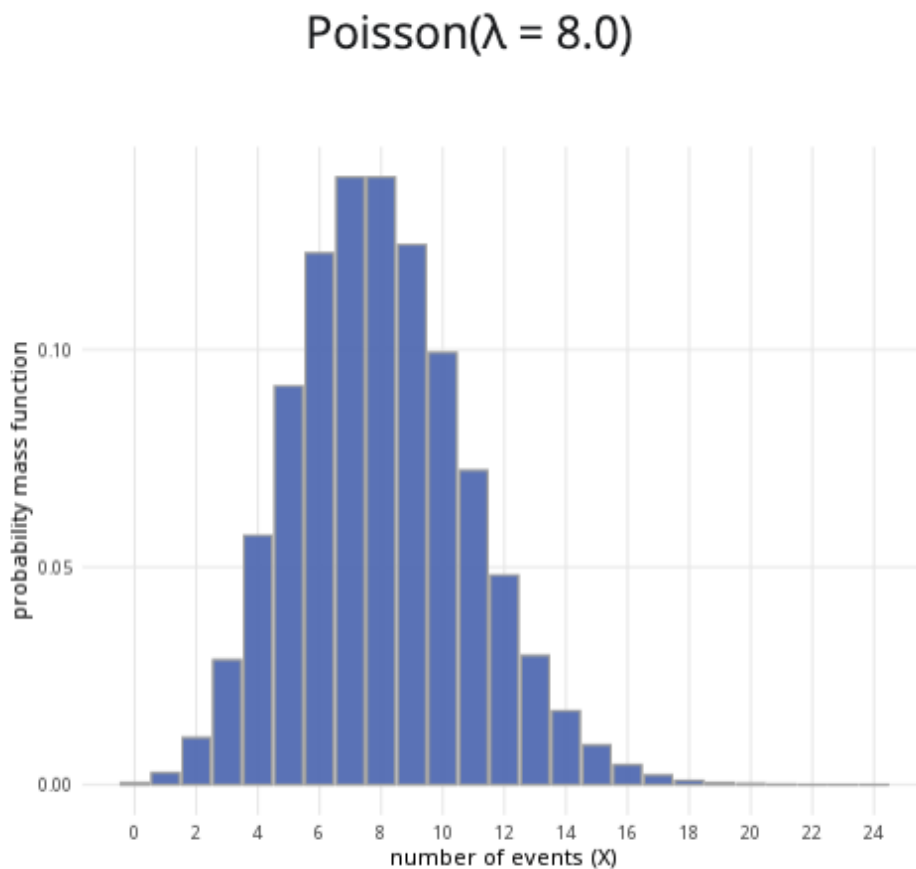

Figure 1: An example of the Poisson distribution with  $\lambda = 8$ .

**Where to use:** The Poisson distribution is used when a specific event occurs at some rate  $\lambda$ , and you are counting  $X$ , the number of times this event occurs in some interval.

**Notation:**  $X \sim \text{Poisson}(\lambda)$  or  $X \sim \text{Pois}(\lambda)$ .

**Parameter:**  $\lambda$  is the integer number of times an event occurs within a specific period of time.

| Quantity | Value                     | Notes |
|----------|---------------------------|-------|
| Mean     | $\mathbb{E}(X) = \lambda$ |       |

| Quantity        | Value                                                                                     | Notes                                  |
|-----------------|-------------------------------------------------------------------------------------------|----------------------------------------|
| <b>Variance</b> | $\mathbb{V}(X) = \lambda$                                                                 |                                        |
| <b>PMF</b>      | $\mathbb{P}(X = x) = \frac{\lambda^x e^{-\lambda}}{x!}$                                   |                                        |
| <b>CDF</b>      | $\mathbb{P}(X \leq x) = \sum_{i=1}^{\lfloor x \rfloor} \frac{\lambda^x e^{-\lambda}}{x!}$ | $\lfloor x \rfloor$ the floor function |

**Example:** Customers enter Cantor's Confectionery at an average rate of 20 people per hour, and you want to see the likelihood that  $X$  number of customers walks in. This can be expressed as  $X \sim \text{Pois}(20)$ .
